

HW4 report

Dengyuan Wang

1. Single layer perceptron with linear activation

function: Accuracy = 85.0%

Learning rate:0.05, Decay: 0.9 per 1K batches; Iteration: 20000

Single-layer Linear Perceptron Confusion Matrix, accuracy = 0.850

2. Single layer perceptron with RELU activation

function: Accuracy = 89.2%

Learning rate:0.05, Decay: 0.9 per 1K batches; Iteration: 20000

Used Leak RELU

Single-layer Perceptron Confusion Matrix, accuracy = 0.892

3. Two layers perceptron with RELU activation

function: Accuracy = 91.0%

Learning rate:0.05, Decay: 0.9 per 1K batches; Iteration: 20000

Used Leak RELU

Multi-layer Perceptron Confusion Matrix, accuracy = 0.910

4. CNN+FC: Accuracy = 93.2%

Use Adam Optimization method: learning rate = 0.1, beta1 = 0.95, beta2=0.99

$v_w = \text{beta1} * v_w + (1 - \text{beta1}) * dl_dw / \text{batchsize}$

$s_w = \text{beta2} * s_w + (1 - \text{beta2}) * (dl_dw / \text{batchsize}) ** 2$

$w -= lr * v_w / \text{np.sqrt}(s_w + 1e-7)$

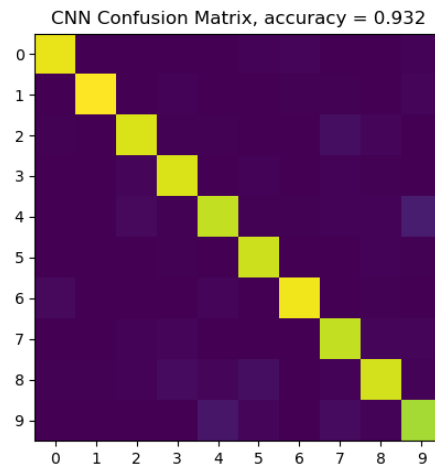

Decay: 0.9 per 1K iteration

Iteration: 10000

Used RELU

X-axis is iteration, Y-axis is loss per batch

For Function implementation details, please refer to the comments in file cnn.py
